

Early Acquisition Decision Making: A Historical Perspective

(Based on A-10 and other Systems Engineering Case Studies)

12 May 2010

David Jacques Air Force Institute of Technology (david.jacques@afit.edu)

Any opinions expressed in this talk are those of the speaker, and do not represent the positions of the Air Force or Department of Defense!

... so please don't tell on me!

Definition:

- 1. A choice from among a set of alternatives
- 2. An irrevocable allocation of resources

But isn't this what we do in engineering design, both at the conceptual level, as well as throughout the development process?

- 1. Formulation of preferences that, for the situation at hand, define good and bad and differentiate levels of goodness
- 2. Generation of a set of alternatives for consideration of choice
- 3. Evaluation of alternatives against the decision maker's preference
- 4. Selection of the preferred alternative in accordance with the decision maker's preference

Sounds easy, right?

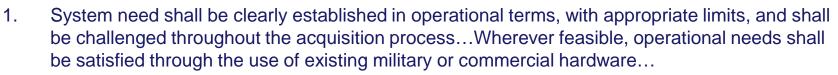

- For most problems the range of possible design options is virtually limitless
- Impossible to know exactly how a particular design will perform until it is built and used
 - The operational environment itself is uncertain, let alone how the system will perform in it
- It is not always straight forward to define a valid measure of value
 - Most design problem are multi-attribute
 - Different stakeholders put different "value" on different attributes
- The dimensionality of typical design is so large that simplified models become necessary to support decision making
 - The models themselves introduce uncertainty

- What are the operational capabilities that are needed?
- Should a conceptual design effort be undertaken?
- What mix of systems (legacy and new) are likely to achieve the desired operational capabilities?
- For materiel approaches (new systems), which system concept (usually a mixture of technologies) should be the basis of the design?
- Which technology for a given subsystem should be chosen?
- What existing hardware and software can be used?
- Is the envisioned concept technically feasible, based on cost, schedule and performance requirements?
- Should additional research be conducted before a decision is made?

- 2. Cost parameters shall be established which consider the cost of acquisition and ownership... Practical tradeoffs shall be made between system capability, cost and schedule...
- 3. Logistic support shall also be considered as a principle design parameter...
- 4. Programs shall be structured and resources allocated to assure that the demonstration of actual achievement is the pacing function... Schedules and funding profiles shall be structured to accommodate unforeseen problems and permit task accomplishment without unnecessary overlapping or concurrency.
- 5. Technical uncertainty shall be continually assessed... Models, mock-ups and system hardware will be used to the greatest possible extent to increase confidence level.
- 6. Test and evaluation shall commence as early as possible. A determination of operational suitability, including logistics support requirements, will be made prior to large scale production commitments...
- 7. Contract type shall be consistent with all program characteristics, including risk...
- 8. The source selection decision shall take into account the contractor's capability to develop a necessary defense system on a timely and cost-effective basis...
- 9. Management information/program control requirements shall provide information which is essential to effective management control... Documentation shall be generated in the minimum amount to satisfy necessary and specific management needs.

- Air Force largely unprepared for Close Air Support (CAS) mission
 - A-1, A-37 had insufficient payload, loiter
 - Incompatible comm with ground units
- Army doctrine evolving towards air mobile tactics
 - Increased reliance on armed helicopters
 - Initiated development of AH-56 Cheyenne
- Johnson-McConnell Agreement
 - AF retained CAS mission, but recognized role of Army helicopters for fire support
 - Army gave up large fixed-wing transports

Task Definition

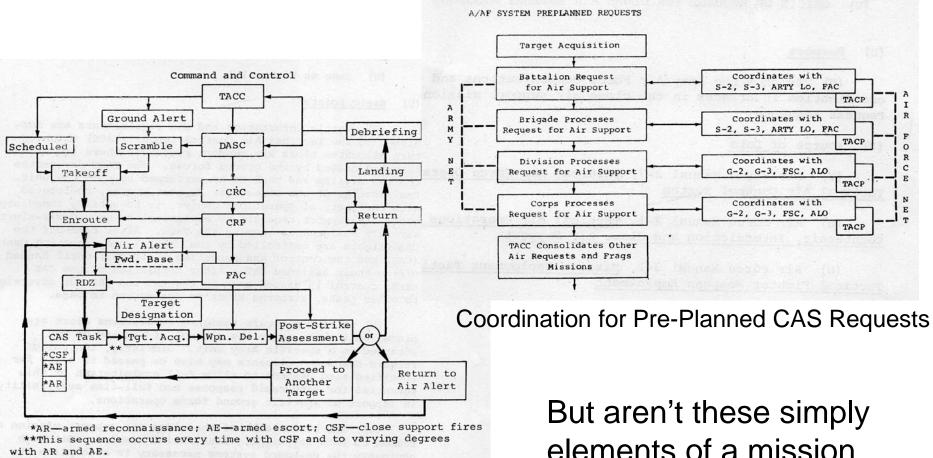

Three Mission Tasks

- Close Support Fire (CSF)
- Armed Escort (AE)
- Armed Reconnaissance (AR)
- CSF and AE were considered complementary
- AR involved different weapons and acquisition systems, considered a secondary A-X mission due to parallel development of AC-130 gunship

The System of Systems Perspective

The Tactical Air Control System (circa 1968)

elements of a mission architecture?

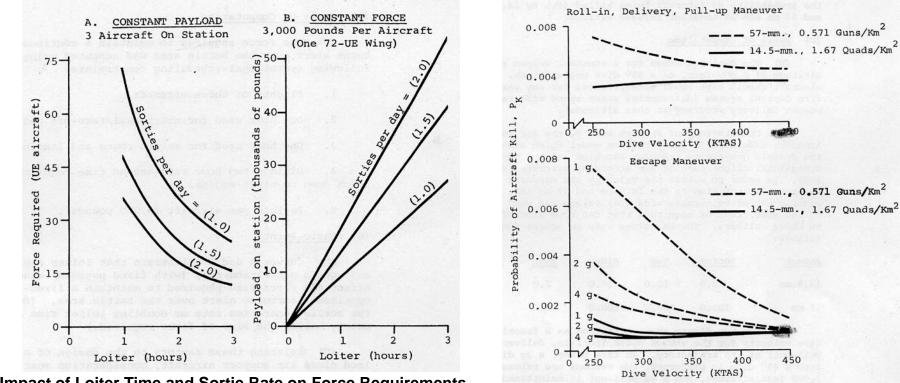

Only four key mission characteristics specified !

- **Responsiveness** considered not just speed, but basing locations, availability, loiter time over target, and ability to communicate with ground elements
- *Simplicity* emphasized ease of production, maintenance, and low cost
- Lethality made it clear that it was not an aircraft development effort, it was a weapon system development
- *Survivability* concerns would drive redundancy, component placement, protection systems, maneuverability, targeting systems, et.al.
- Mission characteristics drove performance parameters, which resulted in concept aircraft configurations
 - Alternatives evaluated against mission and cost effectiveness measures

Attributes and Measures (ctd.)

Impact of Loiter Time and Sortie Rate on Force Requirements

	AFM 26-3 PLANNING MMH/FH	ACTUAL SEA
F-4	30	33.2
*F-105	40	27.6
F-100	25	26.6
F-5	17	15.5
A-1	10	14.3
A-37	7	7.8

Relative Aircraft Attrition Versus Velocity and Maneuver

Maintenance Man Hours/Flight Hour for Vietnam era Aircraft

- F-4, F-111 were the Air Force's primary tactical aircraft of the time
 - Both were expensive, and ill suited to CAS mission
- F-5
 - Initially the Air Force choice for a low-cost tactical fighter
 - Better air-to-air capability than A-7
- A-7D
 - Derivative of existing Navy aircraft
 - Favored by many in OSD, Congress
 - Could not carry a big gun, significantly lower loiter time
 - Would eventually be involved in a flyoff with A-10 prior to production decision
- Army Helicopters?
 - Roles and missions agreements prevented serious consideration

Aircraft Comparison

	<u>A-1J</u>	<u>OV-10</u> (Impr.)	<u>A-37B</u>	<u>A-X</u>	<u>A-7D</u>	<u>F-4C</u>
Operating weight empty (1b) (includes crew, gun, ammunition)	13,328	9,440	6,200	20,140	19,250	31,097 w/gun pod
Internal fuel capacity (1b)	2,280	3,680	2,974	7,000	9,750	12,818
External load capacity-with FIF (1b)	9,392	4, 394	4,826	16,860 [.]	14,000	14,085
VMaximum TOGW (1b)	25,000	17,514	14,000	44,000	43,000	58,000
Engines (number/type)	one R-3350	two T-76	two J-85	two T-55	one TF-41	two J-79
Useful load capacity (fuel and ordnance-lbs) for takeoff- distance (Ground-Run, S.L., Tropic Day) of:	6. 34 O.D. . *		it note		e dana	
750 ft	4,000**	1,300**	3,200**	9,000	-0-	-0-
1,000 ft	6,200**	3,600	4,000**	12,500	-0-	-0-
Maximum speed, clean, S.L. (KTAS)	277	262	417	400	607	M 1.2
Best cruise speed, 5,000 ft, maximum ordnance (KTAS)	170	170	265	240	315	420
Ferry range, unrefueled (NM)	2,800	2,600	1,560	2,600	2,600	1,600
Number of ordnance stations	15	7	8	10	8	5
Internal guns (number/caliber)	four 20-mm	four 7.62-mm	one 7.62-mm	one 30-mm	one 20-mm	*(one SUU-16 20-mm pod)

**Cannot land in this distance at any weight.

Requirements for Requirements A

A-X Concepts

	Performance Parameter	Desired	Required
		22.500	20.000
	Gross Weight (lbs)	22,500	30,000
from Dec 1966	Payload - Mixed Ordnance (lbs)	8,000	6,000
Action Directive	Combat Radius (nautical miles)		200
	Loiter Time @ Combat Radius (hrs)		2
	Min Maneuvering Speed @ 5000 ft (knots)	120	150
	Turn Radius @ Combat Weight (ft)	1,000	2,000
	Max Speed @ Sea Level w/ Ext. Ordnance (knots)	550	450

- Concept design studies conducted in 1967
 - Resulted in two government configurations, and four contractor configurations
- Concept determined to be feasible within existing technology
 - Most configurations used turbo-prop designs
 - Identified risk elements included gun/ammunition development and integration, and early IOC
 - Lean avionics packages defined to keep costs down
- Concept Formulation Package (predecessor to Initial Capability Document) completed in 1968

A-X Concepts

Notes: Significant design changes occurred during Concept Definition (now referred to as Concept Refinement)

- Single or twin turboprop propulsion gave way to twin turbofan (leveraged Navy S-37 aircraft development)
- Payload essentially doubled to 16,000 lbs led to aircraft size/cost growth

- Recall acquisition tenet # 5
 - Technical uncertainty shall be continually assessed... Models, mock-ups and system hardware will be used to the greatest possible extent to increase confidence level.
- The A-X (termed A-10 after downselect) became a pilot program to demonstrate competitive prototyping on a major system development effort*

* The publication of DoD 5000 did not occur until a few months after the start of the A-X development program, but these policy ideas from the Office of the Secretary of Defense clearly influenced the A-X program formulation. In some respects, the A-X program was a test bed for considerations such as design-to-cost, supportability in design, and competitive prototyping.

A-X Prototyping

- A-X Pilot Parallel Undocumented Development
 - Favored by DepSECDEF David Packard and AFSC/CC Gen Ferguson
 - Require minimal documentation during the competitive prototype phase to encourage innovation and initiative on the part of the contractor.
 - Expected to reduce technical risk and lead to a better source selection decision at the expense of higher RDT&E cost
- A-X was unique in this approach
 - F-X (later termed F-15), initiated in the same year, followed traditional "paper" Concept Definition approach to source selection

- Aircraft
 - Two competitors selected from six bidders for competitive prototyping phase
 - Northrop (YA-9) and Fairchild (YA-10)
 - Competitive fly-off by AF pilots after ~2.5 years in development
 - Downselect based on design, cost, risk, and flying performance
- Gun
 - Two competitors selected to design/build prototype guns
 - GE (GAU-8) and Philco-Ford (GAU-9)
 - Each competitor responsible for separate ammunition development
 - Competitive shoot-off after ~2.5 years in development; only GE was able to demonstrate a satisfactory gun system
- Ammunition
 - After gun downselect, GE directed to retain two ammunition subcontracts
 - Targeted downselect for ammunition was to be two years after IOC for first independent ammunition order; prior orders part of gun contract

A-X Competitive Prototyping Rationale and Outcomes

- Aircraft development was considered low risk, but gun development and integration was considered higher risk
 - Ammunition for gun was also considered higher risk
 - Ammunition cost was projected to make up 90% of the life cycle cost for the gun system
- Aircraft fly-off successful for both Northrop and Fairchild
 - Fairchild A-10 chosen based on cost, risk, and a "simpler" design for manufacture and maintenance
- Gun prototype demonstration eliminated Philco-Ford from consideration, and positively demonstrated feasibility and effectiveness of GE design
- Reports have suggested that extensive efforts in technology development and competition contributed to an 80% reduction in ammunition from the original cost estimate

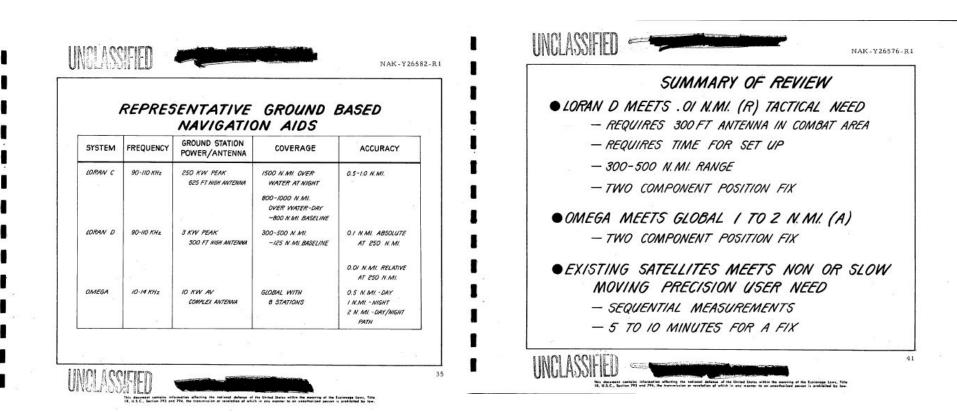

- Capability Based Assessment for navigation support
 - Definition of tasks, attributes and measures
- Initiated a joint development program
 - (primarily AF and Navy)

OTHER USERS OF S TACTICAL BO	YSTEM SATISFYING MBING GOALS	OTHER DESIRED CHARACTERISTICS			
OPERATION ACCURACY / FIX FREQUENCY		• COVERAGE

• Capability Based Assessment considered the adequacy of current and programmed systems

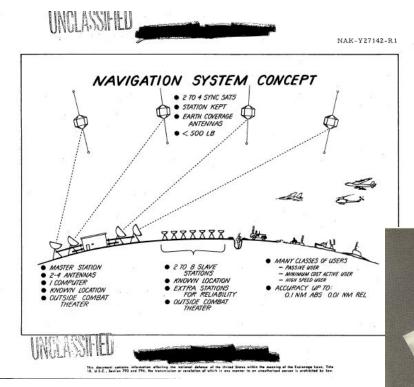

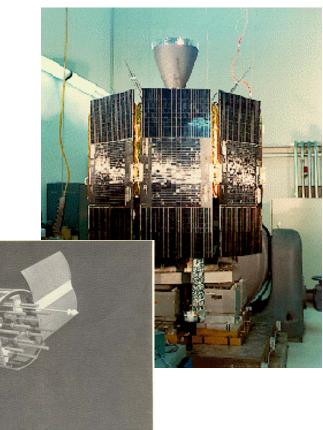

The GPS Concept

- Concept Definition package done in 1967!
- System of Systems Implications

Did A-X and GPS concept formulation adhere to (in retrospect) Joint Capability Integration and Development System (JCIDS) principles?

Yes ... , kind of ...

- Clear definition of tasks, conditions and measures
- Consideration of a range of existing systems to provide the needed capability
- Concept formulation traceable to previously defined tasks, conditions and measures

Shortcomings

- With A-X, no serious consideration of the full range of joint warfighting concepts to meet the capability needs
- Others?

Contractor Assessment

- Remember AcquisitionTenet 8?
 - The source selection decision shall take into account the contractor's capability to develop a necessary defense system on a timely and cost-effective basis...
- Fairchild's production capability and financial healthassessed prior to contract award
 - Had not produced an aircraft in over 15 years
 - Had not modernized production equipment
- Air Force re-assesses contractor prior to production decision
 - Forced changes in capital investment, workforce and management, and production location
- Epilogue Fairchild ceased to exist shortly after the end of the production run for A-10

Q: Can you name this aircraft, and who was it developed for?

A: This is the F-111B, developed for the Navy !

- OSD mandated that F-111 be joint (AF/Navy)
 - 80% commonality required
- Air Force and Navy had different mission needs
- F-111B became to big to fit on Carriers Navy pulls out
- AF continues program, but can't reverse many design decisions

Conclusion

- An often quoted statement:
 - Those who don't learn the lessons of the past are condemned to repeat them
- So are we learning them, or repeating them?
