

OverKey® radically simplifies deployment of high-assurance encryption in austere environments. OverKey is a distributed multicast Virtual Private Network (VPN) that enables secure, collaborative communications in Internet of Things networks.

OverKey® integrates our patent-pending software with commercial of-the-shelf (COTS) radio and compute modules to yield an affordable, scalable, and secure datalink for networked, collaborative, and autonomous systems. Bringing OverKey to market will ensure significant cost savings for any distributed architecture, and resilient C³ for our Warfighters.
